Permanent Resident in Toronto, ON

Summary

Software Engineer with 4+ years of experience designing scalable, cloud-native backend microservices. Skilled at building reliable distributed systems with Python, Go, API design, database optimization, observability, and CI/CD automation.

Work Experience

Intermediate Software Engineer at Achievers, Toronto

October 2025 - Present

- Design, develop, and maintain cloud-based Python and Go microservices for a global B2B SaaS, using GCP, gRPC, Pub/Sub, and Kubernetes (GKE) for scalable service communication and deployment.
- Contributed heavily to design and implementation of a resilient top-up checkout workflow, building Python back-end flows, a Go-based Avalara tax integration, Stripe payment handling, and saga-style distributed transaction coordination.
- Contributed to Elasticsearch indexing pipeline simplification, helping evaluate architecture tradeoffs and implementing Go batch processor workers, queue tuning, and Airflow/Dataflow orchestration changes that reduced cluster CPU by 30% and memory pressure by 20% while keeping search latency under 200ms.
- Built internal AI tooling with a RAG pipeline and MCP server for vendor API documentation, retrieval, and JSON config validation, reducing vendor integration timelines from 4 weeks to 3 and helping the team exceed its annual integration goal by 20% (12/10).
- Improved New Relic observability for Elasticsearch data sync queues with custom queue-state events, backlog alerts, and dashboards; implementation pattern was later standardized in the shared batch processing library.
- Mentored 2 co-op software engineers through onboarding and project delivery, providing code reviews, pair programming support, and technical guidance across marketplace backend services.

Software Engineer at Achievers, Toronto

November 2022 - October 2025

- Created reusable GraphQL endpoints with Fastify, Node.js, and TypeScript, serving as a gateway and data aggregation layer between gRPC microservices, legacy REST APIs, and front-end applications.
- Utilized Google Cloud Platform (GCP) services including Kubernetes Engine, Artifact Registry, Pub/Sub, gRPC, Cloud Storage Buckets, and Secret Manager for application deployment, communication, and storage.
- Maintained highly available order processing and vendor integration services for a marketplace platform handling 10+ orders/min (\$10M+ 2024 revenue), resolving critical production issues within SLAs.

Web Developer at Tecnoglass, Colombia

November 2021 - November 2022

- Developed web applications using Python, Django, JavaScript, and PostgreSQL to reduce paperwork and optimize business processes; built a centralized Flask REST API for LDAP-backed authentication.
- Designed and implemented a LoRaWAN temperature and humidity monitoring system for glass assembly plants, including hardware selection, installation, and a real-time Django Channels dashboard.

Education

B.Sc. in Electronic Engineering from Universidad del Norte, Colombia

Graduated March 2023

- Graduated cum laude in recognition of the excellence of my final thesis and academic performance.

Skills

- **Languages:** Python, Go, JavaScript, SQL, TypeScript, PHP, HTML, CSS.
- **Frameworks:** Flask, FastAPI, Django, GraphQL, React.
- **Cloud & DevOps:** Google Cloud Platform (GCP), AWS, DroneCI, GitHub Actions, Airflow.
- **Technologies:** MySQL, PostgreSQL, MongoDB, Redis, Elasticsearch, gRPC, Pub/Sub, Docker, Kubernetes, New Relic.
